

KOGA Network

Project Overview & Technical Whitepaper

BNB48 Governance & Utility Protocol

A structured overview of the KOGA token, its supply policy, core purpose, and available project links.

Prepared from the supplied project text. This document reorganizes and expands the supplied material for clarity and presentation; it does not independently verify on-chain or external claims.

1. Executive Summary

KOGE Network is presented in the supplied material as a decentralized governance and utility protocol built on the BNB Smart Chain (BSC). The project centers on the BNB48 Governance Token, identified by the symbol KOGE, and describes the token as a secured BEP20 implementation intended to support transparent community decision-making and utility within the BNB48 ecosystem.

The project documentation emphasizes three central principles: compatibility with the BEP20 ecosystem, a defined maximum supply, and governance-controlled token generation for stated ecosystem purposes. Together, these elements are positioned as the foundation for a transparent and community-oriented protocol.

2. Token Specifications

The KOGE token follows the BEP20 standard. According to the supplied document, this is intended to provide compatibility with decentralized exchanges, wallets, and DeFi protocols operating on BNB Smart Chain.

Specification	Value
Token Name	BNB48 Club Token
Token Symbol	KOGE
Decimals	18
Network	BNB Smart Chain (BEP20)
Contract Address	0xe6df05CC6F17A36B247eddC22fe3b9cFCcE91714

3. Tokenomics & Supply Management

The supplied documentation describes a disciplined monetary policy intended to support long-term sustainability and trust. The policy distinguishes the initial supply from the protocol's hard cap and specifies a governance-controlled mechanism for generating additional tokens.

Parameter	Defined Value / Rule
Initial Supply	3,000 KOGE (Strategic pegging phase)
Maximum Supply (Hard Cap)	500,000,000 KOGE
Minting Logic	Total supply can never exceed the hard cap. New tokens are generated exclusively

Supply-control principle: The hard cap is the upper boundary stated by the project. The supplied text therefore presents token issuance as constrained rather than unlimited, with additional generation tied to secured governance actions.

4. Core Protocol Features

BEP20 Compatibility — KOGE is specified as a BEP20 token on BNB Smart Chain, supporting the project's stated compatibility objective with wallets, decentralized exchanges, and DeFi protocols.

Governance Orientation — The project is designed around decentralized governance, with the stated goal of giving community participants a direct role in the protocol's evolution.

Capped Supply — A maximum supply of 500,000,000 KOGE is specified, establishing a defined upper limit for token issuance.

Governance-Controlled Minting — The supplied documentation states that new tokens may be generated through secured governance actions for reward distribution and ecosystem growth, while remaining below the hard cap.

Transparency & Community Participation — The project positions transparent decision-making and community participation as central objectives of the BNB48 ecosystem.

Important documentation note: the original source contains a heading for this section but does not provide a detailed technical list of additional modules, smart-contract functions, security mechanisms, voting parameters, or governance workflows. Those details have therefore not been invented in this document.

5. Vision and Roadmap

The stated vision is for KOGE Network to become the primary governance layer for the BNB48 community. The project describes this vision through a secure, capped, and transparent utility token intended to enable decentralized collaboration and allow holders to influence the protocol's evolution.

Roadmap status: The supplied text provides the vision statement but does not include dated milestones, development phases, launch targets, audit milestones, exchange listings, or specific product releases. No additional roadmap events are asserted here.

6. Project Structure at a Glance

Based strictly on the supplied material, the project's high-level structure can be summarized as follows:

Layer	Role described in the source
Blockchain	BNB Smart Chain (BSC)
Token Standard	BEP20
Core Token	BNB48 Club Token (KOGE)
Governance Role	Community-oriented decision-making and protocol evolution
Supply Policy	Initial supply of 3,000 KOGE; hard cap of 500,000,000 KOGE
Issuance Rule	Governance-controlled generation for rewards and ecosystem growth, subject to

7. Contract & Transparency Reference

For technical or community review, the supplied project document identifies a specific BNB Smart Chain contract address for KOGE. Readers should independently verify the contract address and on-chain state through a trusted blockchain explorer before interacting with any token or contract.

Network	BNB Smart Chain
---------	-----------------

Contract	0xe6df05CC6F17A36B247eddC22fe3b9cFCcE91714
Standard	BEP20

9. Conclusion

KOGE Network is described as a BNB Smart Chain-based governance and utility protocol centered on the KOGE token. Its supplied specifications define a BEP20 token with 18 decimals, an initial supply of 3,000 KOGE, and a maximum supply of 500,000,000 KOGE. The project further states that token generation is controlled by secured governance actions and cannot exceed the hard cap.

The overall project narrative is therefore built around compatibility, capped supply, governance participation, and community-oriented utility. For a future full technical whitepaper, the most useful additions would be detailed governance mechanics, smart-contract architecture, security/audit information, token distribution, reward rules, and a dated roadmap—provided those specifications are formally defined by the project.
